A series of 11 photographs showing the main elements of the Hebridean barrier islands.

A. Oblique aerial view looking seaward across exposed strandflat surface. Barrier islands are developed along seaward edge.
B. Intertidal outcrop of strandflat surface over which islands migrate
C, D, E. Views across seaward edge of barrier islands showing underlying bedrock, beach and dune edge.
F. Panoramic view from intertidal bedrock, across beach, foredune and flat machair plain.

G. View of landward margin of barrier island, showing lagoon to landward and exposed strandflat surface.
H. Margin of tidal inlet and adjacent beach and dune. Note the scattered outcrop of bedrock surface.

I. Intertidal sand beach adjacent to exposed bedrock surface.
J. Foreshore outcrop of back-barrier peat overlain by storm pebble ridge and dune/machair sand

K. Exposed seaward edge of foredune showing alternating sand and soil horizons.
